

Ordinal survey methods

Synthetic project material for retrieval testing; no external authority is claimed.

Method identifier: ordinal_survey_method_v1.

satisfaction is an ordinal score from 1 to 5. A candidate method is to show category frequencies, valid sample counts and a median after the user confirms missing-value handling.

department can define descriptive groups when the task asks for a department comparison. Small groups do not justify a department ranking or a causal conclusion.

These are proposed steps. No grouped statistics have been calculated in this intake stage.

Identifiers and interpretation

Synthetic project material for retrieval testing; no external authority is claimed.

Method identifier: identifier_preservation_v1.

Preserve respondent_id as text, including leading zeroes such as 001. Do not infer a numeric measurement from an identifier.

experience_years equal to 0 is a valid recorded value. In comment, NA and NULL remain literal strings until the user confirms missing-value semantics.

Confirm the target population, group comparison scope and missing-value rules before running analysis.

This document does not establish causal effects.
